

Metals Outlook 2024 Better days ahead

Positive inflexion. For most of 2023, industrial metals have been trapped in a balanced bear market. The ex-China surplus generated by the rates-induced manufacturing downturn, reinforced by persistent destocking, has counteracted tightening from robust China demand. A heavy price environment has resulted, with the S&P GSCI Industrial Metals index falling 6% YTD. Going into 2024, while an immediate wholesale change in dynamics is unlikely, we expect a persistent tightening bias from a combination of policy-underpinned China demand and a troughing in DM demand set against, in the most part, progressively greater supply binds. These factors should support a positive inflexion in sector performance (GSe +18% 12M target), centred on upside in aluminium (\$2,600/t 12M target) and copper (\$10,000/t 12M target), with modest offset from nickel downside (\$15,000/t 12M target vs \$16,000/t previously).

China's green policy 'put'. The most supportive fundamental this year has been China's surging metal demand, supported by the green economy, grid and property completions. Yet domestic destocking and supply strength, alongside rates-constrained trader activity, have limited an equivalent import uplift. However, given our economists' expectation for a policy-put-underpinned growth path, and now negligible onshore stocks, China's metal import pull will likely be stronger ahead. That applies to metals in particular, given domestic smelting restraints (aluminium, zinc) and lack of inventory cover (copper). Into H1-2024, China should remain a powerful offset to the drag elsewhere, limiting left-tail price risk in our view.

Waiting on Western destocking. The drag from DM end-demand deterioration, exacerbated by destocking, has been the most significant softening effect. Indeed, there is little immediate evidence of a turn in this dynamic, with persistent sluggish spot physical conditions. Nonetheless, a fade in the destocking effect should provide a positive adjustment, which our economists expect to support the manufacturing cycle back to firming trend growth. Evidence of a troughing in European PMIs so far in Q4 is encouraging in this respect. The elevated DM rates environment will restrain capital-intensive demand segments, though base effects and emerging green demand suggest now is peak contraction. Once DM demand growth returns, something we forecast in our base case from mid-2024, stickier more substantive price upside is likely.

Supply binds differentiate. In this demand environment, relative supply conditions

will be decisive for the price path. Aluminium is seeing the most immediate bind from China's capacity cap and winter cuts, offering the most supportive setup. Copper's final gasp of mine supply growth in H1-2024 – if achieved – would be a tightening limitation, though the transition then to peak output should eventually support scarcity pricing. Iron ore's limited supply growth and stock buffers leave it vulnerable to tightening surprises. Conversely, surging nickel and lithium supply suggest price downside will be required. This underpins a continuation in our favoured basket trade expressions for industrial metals (long aluminium and copper vs. short nickel and zinc) and short battery metals (lithium, nickel, cobalt).

Gold's shine is returning. We see an environment developing for gold with a fattening in right-tail price risk into next year. The potential upside in gold prices will be closely tied to US real rates and dollar moves, but we also expect persistent strong consumer demand from China and India, alongside central bank buying to offset downward pressures from <u>upside growth surprises</u> and rate cut repricing. On net, we would expect any sell-offs to be limited in scale due to a <u>dovish Fed, slowing wage growth</u>, and <u>resilient central bank purchases</u>. Tactically, we would view a sell-off in gold as a buying opportunity, as we see an environment with elevated risk channels ahead playing into gold's hedge qualities. We maintain our <u>12M gold target at \$2050/toz</u>, albeit with risks skewed to the upside.

Better days ahead

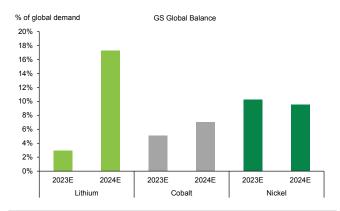

1. Positive inflexion. For most of 2023, industrial metals have been trapped in a balanced bear market. The ex-China surplus generated by the rates-induced manufacturing downturn, reinforced by supply chain destocking, has counteracted tightening from healthy China demand. Heavy price setting has resulted in the S&P GSCI Industrial Metals index falling 6% YTD, albeit differentiated by relative supply conditions limiting downside in aluminium (-6%) and copper (flat) versus greater downside in other metals (nickel -44%). Going into 2024, while an immediate wholesale change in dynamics is unlikely, we expect a persistent tightening bias from a combination of three key supportive market elements compared with this year: (1) ongoing China policy easing underpinning a resilient green-tinted onshore metals demand environment, with reduced stock buffers supporting higher metal imports, (2) a stabilisation in Western metals demand tied to an end in the destocking cycle and rising green consumption, and (3) more significant supply binds due to a depleting growth pipeline as well as margin-related supply rationing effects. In this context, we expect a positive return for industrial metals over the next 12 months (GSe +17.8%) centred on upside in aluminium (\$2,600/t 12M target) and copper (\$10,000/t 12M target) with offset from nickel downside (\$15,000/t 12M target vs. \$16,000/t previously) in particular.

2. China's green policy 'put'. One of the outstanding features of industrial metals markets this year has been China's metals demand outperformance for the aggregate

industrial economy. Onshore demand for aluminium (+5% y/y ytd vs. GSe +4.4% y/y Jan'23) and copper (+12% y/y ytd vs. GSe +6% y/y Jan'23) has been exceptionally strong through the course of this year. This has been rooted in the rapid growth in the metals-intensive green economy (renewables, EVs), as well as related investment in grid upgrade, with some non-green support also from elevated property completions supported by the destock of previously delayed new projects. While this effect alone has clearly not been enough to generate significant global deficits this year, it has nonetheless prevented a rebuild in market inventory buffers and the related ongoing trend higher in China's metals imports is now offsetting the ex-China demand drag. Importantly, as our economists have recently emphasised, more significant policy support is anticipated into 2024. This should underpin growth in metals-intensive manufacturing and infrastructure investment. In this context, we continue to expect a resilient China green metals demand environment with a strong existing pipeline (solar projects and EV production plans) to be further supplemented ahead. This should support only a modest deceleration in China metals demand next year (GSe +3% average). At least in H1-2024, China will remain an offset to the drag elsewhere before broader competition and price support emerge later in the year.

3. Waiting on Western destocking. The drag from ex-China end-demand deterioration, exacerbated by supply chain destocking, has been the most significant softening effect on metal fundamentals this year. We estimate ex-China metals end-demand has on average contracted 1% this year, though midstream supply chain destocking means that the physical apparent demand contraction has been greater (5-10%). On immediate inspection, there is little evidence of an inflexion in these trends - Western metals premia remain pressured, spot market activity limited and order books into next year light. Nonetheless, we expect a more positive path ahead for ex-China demand, with an average +3% growth across our covered metals next year. This recovery trajectory is rooted in three key factors. First, we expect a fade in the destocking effect to provide a positive adjustment, which our economists see supporting a convergence in the manufacturing cycle back to firming trend growth. Evidence already suggests that the destocking cycle has matured in the US, though it will likely persist in Europe until H1 next year. Second, we also anticipate more significant growth in green demand channels across the ex-China demand side, tied to growth in the DM EV sales volume (+1.7mil units, 35% y/y) and solar installations (+15GW, +15% y/y) in particular. Third, while there

will likely remain a drag from capital-intensive segments such as building and construction, we also expect resilience in auto production. This is tied to continued growth in EV uptake and supply-chain rebalancing. However, until growth returns to DM metals demand, something we forecast in our base case from H2 next year, broad bullish price momentum is unlikely.

4. Aluminium: Increasing tightness on China's supply bind. Aluminium has spent much of the past year trapped in <u>a depressed equilibrium</u> between destocking-exacerbated DM demand headwinds and an uplift in China import demand. This has left the global primary market in a modest deficit this year (GSe 634kt deficit), visible stocks close to flat YTD (now totaling 1.1Mt) and LME prices down modestly (-6% YTD). As we look into 2024, we expect a larger full-year global primary deficit (GSe 1.2Mt vs. 784kt deficit previously), albeit split between a 1.6Mt deficit in China and 370kt surplus in ex-China. The tightening increment reflects primarily the impact of China's supply bind, where a combination of hitting the capacity cap and Yunnan winter cuts means that onshore primary production will likely only grow 2% next year and peak

in 2025. The key implication of this stagnating supply path is that, even with a moderation in onshore demand growth, China's balance is moving into more significant deficits ahead (GSe 1.6Mt in 2024, 1.5Mty in 2025 vs. 1.1Mt in 2023) and, as such, more sizeable metal import requirements. Given our expectation for a trough in ex-China demand (GSe +4% y/y in 2024 vs. -1% y/y in 2023), reinforced by less physical drag from DM destocking, the market should ultimately transition towards greater competition for units and support for higher prices over the course of next year. Visible primary aluminium inventories remain low (just 1.1Mt), which is smaller than our expected global deficit next year, suggesting that prices will need to rise to support ex-China producer margins (with 2.5Mty currently loss-making). Overall, we continue to target upside in the aluminium LME price with 3/6/12M targets of \$2,300/2,400/2,600/t.

5. Copper: Balancing supply headwinds, green tailwinds. Copper has spent much of the past year trading in a narrow range in the mid-low \$8,000s, just above the top of the cost curve. This has, in turn, reflected a tightly balanced market with low inventory cover (GSe 93kt deficit in 2023 vs. 147kt deficit previously). That has reflected an environment

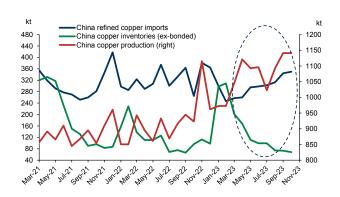

of offsetting fundamental surprises, with significantly stronger China demand than widely expected, offset by weaker ex-China demand and stronger China refined output. As we look into 2024, we expect a modest tightening in the aggregate refined balance (GSe 155kt), though this should generate more significant visible tightening effects given less destocking flex. As we have highlighted previously, concentrate destocking has led to the significant refined supply outperformance of mine supply so far in 2023. Our base case mine supply path for next year (GSe +5% vs +2% in 2023) suggests that at least during H1-2024 there will be enough concentrate availability to support continued strength in refined production to limit cathode tightness. There remains elevated risk that disruptions on the mine supply side could curtail that supply path, and with global mine supply set to peak over 2025-26, there is ultimately a firm supply bind on a 12M horizon. On demand, while we expect a deceleration in China's copper demand growth rate next year (GSe +2% y/y vs. +5% y/y in 2023), the ongoing policy easing support onshore suggests there is right-tail risk to this assumption. Equally, our expectation for a recovery in ex-China demand (Gse +4% y/y vs. -1% y/y in 2023) remains vulnerable to left-tail risk if the expected bottom in industrial production fails to materialise. Nonetheless, with visible copper inventories at 260kt - just 4 days of demand cover – as the metal pivots into more significant tightness from H2 next year, we expect a particularly sharp repricing to the upside. In this context, we continue to target accelerating upside in the copper LME price, with 3/6/12M targets of \$8,400/8,850/10,000/t.

6. Zinc: Finding the bottom. We think the market has reached the bottom in zinc prices, with next year's surplus declining due to concentrate supply rationing. Since mid-year several other zinc mine operations (Tara, Aljustrel, Middle Tennessee) have suspended production due to falling prices and cost inflation, bringing c.250kt equivalent of zinc mine supply to a halt. This has tightened the concentrate market, weighing on treatment charges, and restrained onshore refined zinc production, which has contributed to the trend of higher metal imports into China over the past months. This dynamic has played out when zinc demand in China has outperformed expectations and remained strong YTD (+7% year-to-Oct y/y). In our latest supply-demand balance, we now project the refined zinc market to be in a 107kt surplus in 2023 (173kt surplus previously), followed by smaller surplus than previously expected in 2024/25 (see Exhibit 43). The main tightening adjustment has been a lower concentrate supply (Exhibit 44) due to cost-related cuts resulting in our conclusion that this points to a bottom in zinc prices; our new 3/6/12m targets are \$2,450/\$2,575/\$2,600/t (versus \$2,250/\$2,100/\$2,000/t previously). We also lift our full-year average for 2024/25 to

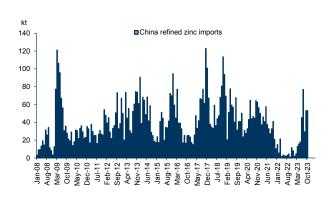

\$2550/2650/t (vs \$2,100/t for both previously). Nonetheless, more significant supply rationing is needed to generate sustained price upside in the current ex-China demand environment, in our view. Zinc demand does not possess the structural bullish green demand dynamics of copper and aluminium; therefore, a turn in industrial demand – particularly in construction – will be essential to generate sustained upside price action if more material supply cuts do not emerge from here (see Exhibit 46).

Exhibit 43: Refined zinc balance has softened materially due to cost inflation led supply rationing

7. Iron Ore: Resilience with a fat right tail. For much of 2023, iron ore has been seen as the China commodity property short. Yet, the commodity's fundamental and price resilience has defied these expectations. Indeed, rather than facing a surplus for this year, we now expect the iron ore market to be in a clear deficit (GSe 39Mt deficit). While China's steel demand remained in clear contraction, the feed-through into iron ore demand has been limited by outperforming steel production underpinned by a lack of (expected) policy cuts, sustained steel export strength and restrained scrap-based EAF output. Set against disappointing iron ore supply trends from both Australia and Brazil, alongside low supply chain stocks, the market has supported higher prices than earlier expected. The path into 2024 now points to a balanced market versus previous surplus, suggesting no imminent glut risk ahead. Recent feedback from China suggests that

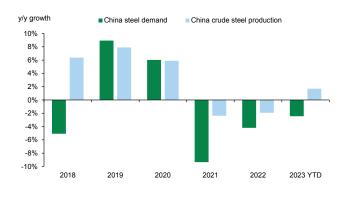

mills are likely to sustain production into Q1 underpinned by building forward demand confidence, and still strong export order books. At a raw material level, we also note that pig iron production remains lower-cost than using scrap, which would continue to support elevated iron ore demand on a relative basis. With onshore mill restocking likely ahead of Chinese New Year and low supply chain inventories, price resilience with greater risk to the upside than downside is now the year-end setting. In this context, we see better price support with our full-year average 62% iron ore forecast for 2023 at \$117/t and for 2024 to \$110/t, and 3/6M targets of \$130/120/t signaling resilient pricing relative to the forward curve pricing.

8. Nickel: Surplus pressures building. The nickel market has started to witness pressure from the mounting surplus in the class 1 market, with LME nickel prices falling to a 2-year low. The feedback from the onshore nickel market reaffirmed our expectation that significant class 1 surplus visibility lies ahead with likely continued price pressures. These signals align with our latest supply-demand estimate that places the global nickel market in a 318kt surplus this year, balanced between a 242kt surplus in class 2 nickel and 75kt surplus in class 1 nickel. We expect surplus pressures to mount into 2024 (GSe 328kt surplus), with a significant increase in the class 1 surplus (GSe 180kt surplus) driven by an increase in cathode production in both Indonesia and China. The main additions in class 1 supply are coming from the ramp-up of chemical production through NPI to matte conversion and HPAL (GEM, CNGR, Jinchuan and Huayou Cobalt), alongside new metal capacities in China. We expect Chinese refined assets to add c.250kty of supply in the form of metal and nickel sulphate in 2023-24. In terms of upside risks, Indonesian industrial policy and potential for a future ban on NPI exports or higher export taxes will remain a key area of focus. While supply shocks and macro

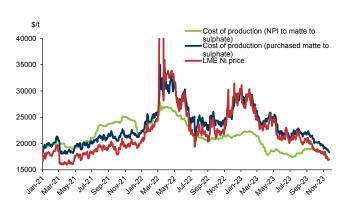

policy shifts can lead to short-covering, given the magnitude of class 1 surplus that we believe still lies ahead in 2024, we remain bearish on nickel. The history of the nickel market suggests a substantial and sustained price overshoot into the cost curve is likely necessary to materially rebalance the forward balance path. In this context, we lower our 3m LME nickel target to \$16,000/t (from \$19,000 previously) and our 6/12m targets to \$15,000/t (from \$17,000/\$16,000/t previously).

9. Lithium: The rationing phase. A rise in supply combined with a shift lower in retail EV volume growth in China (+2.7Mil units in 2022 vs +1.5Mil units in 2023E) has weighed on lithium prices this year. The lithium market is largely balanced in 2023, but we continue to expect a substantial surplus (202kt) over next year. The key softening factor for the balance is the increase in spodumene supply – in particular from Australia and Chinese-owned African assets – adding c.200kt LCE, 55% of total supply growth). This spodumene supply growth, combined with a ramp-up of Chinese lepidolite and brine assets, should add on average 408kty of supply vs a demand growth of 300kty over 2024-25 each year. While lithium prices have corrected sharply, the critical question at the current juncture relates to whether supply adjustments generated by the current price level are enough to limit oversupply. It is true that the elevated cost of production for non-integrated lithium carbonate puts c.80kty capacity currently in a loss-making position. However, we expect the non-integrated cost of production using purchased

Goldman Sachs Metals Outlook 2024

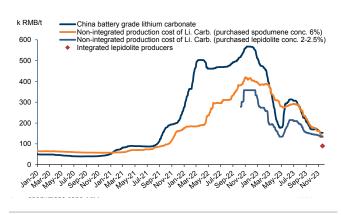

spodumene (c.120kty in 2024) to fall on average to \$14,000/t LCE on a lagged correction in spodumene prices by mid-next year. Furthermore, the total cost for integrated lepidolite production (\$11-\$14k/t LCE) is substantially below current price levels. In this context, we continue to expect China lithium carbonate prices to fall to \$15,000/t and Asia lithium hydroxide to \$16,500/t over the next 12 months. The main risk, in our view, to a low-cycle in lithium pricing comes from delays to Chinese expansions from land quota limitations, which are required for tailing management, or slower spodumene ramp-ups.

Exhibit 58: Prices are still substantially above the levels required to balance the market

10. Gold: Time to shine. Gold's performance this year has been closely tied to its attractiveness as a tail risk hedge and its relationship with real rates and the dollar. Consistent with gold's historical performance during episodes of high geopolitical tension, prices rose substantially (8%) over the first 25 days since the onset of the Israel-Hamas war, but subsequently fell on fading risk premia and strong US data. The pace at which this geopolitical risk premium was priced pointed to a market that was short entering this episode, and the subsequent fall in prices showed the pressure from elevated rates and a strong dollar. Over the past week, prices have risen again on expectations of a rate cut in the March 2024 FOMC meeting and a weaker dollar following the latest US inflation report, which showed inflation falling faster than

expected. Going forward, the rally in gold prices will be closely tied to US real rates and dollar moves, but we also expect strong consumer demand from China and India, alongside central bank buying, to offset downward pressures from upside growth surprises and rate cut repricing. On net, we would expect any sell-off to be limited in scale due to a dovish Fed, slowing inflation, and resilient central bank purchases. Tactically, we would view any sell-off in gold as a buying opportunity as we see an environment with elevated risk channels (geopolitics, recession pricing) ahead playing into gold's hedge qualities. We maintain our 3/6/12m gold target at \$2050/toz, albeit with risks skewed to the upside.

Disclosures

Regulatory disclosures

Disclosures required by United States laws and regulations

See company-specific regulatory disclosures above for any of the following disclosures required as to companies referred to in this report: manager or co-manager in a pending transaction; 1% or other ownership; compensation for certain services; types of client relationships; managed/co-managed public offerings in prior periods; directorships; for equity securities, market making and/or specialist role. Goldman Sachs trades or may trade as a principal in debt securities (or in related derivatives) of issuers discussed in this report.

The following are additional required disclosures: **Ownership and material conflicts of interest:** Goldman Sachs policy prohibits its analysts, professionals reporting to analysts and members of their households from owning securities of any company in the analyst's area of coverage. **Analyst compensation:** Analysts are paid in part based on the profitability of Goldman Sachs, which includes investment banking revenues. **Analyst as officer or director:** Goldman Sachs policy generally prohibits its analysts, persons reporting to analysts or members of their households from serving as an officer, director or advisor of any company in the analyst's area of coverage. **Non-U.S. Analysts:** Non-U.S. analysts may not be associated persons of Goldman Sachs & Co. LLC and therefore may not be subject to FINRA Rule 2241 or FINRA Rule 2242 restrictions on communications with subject company, public appearances and trading securities held by the analysts.

Additional disclosures required under the laws and regulations of jurisdictions other than the United States

The following disclosures are those required by the jurisdiction indicated, except to the extent already made above pursuant to United States laws and regulations. Australia: Goldman Sachs Australia Pty Ltd and its affiliates are not authorised deposit-taking institutions (as that term is defined in the Banking Act 1959 (Cth)) in Australia and do not provide banking services, nor carry on a banking business, in Australia. This research, and any access to it, is intended only for "wholesale clients" within the meaning of the Australian Corporations Act, unless otherwise agreed by Goldman Sachs. In producing research reports, members of Global Investment Research of Goldman Sachs Australia may attend site visits and other meetings hosted by the companies and other entities which are the subject of its research reports. In some instances the costs of such site visits or meetings may be met in part or in whole by the issuers concerned if Goldman Sachs Australia considers it is appropriate and reasonable in the specific circumstances relating to the site visit or meeting. General disclosures

This research is for our clients only. Other than disclosures relating to Goldman Sachs, this research is based on current public information that we consider reliable, but we do not represent it is accurate or complete, and it should not be relied on as such. The information, opinions, estimates and forecasts contained herein are as of the date hereof and are subject to change without prior notification. We seek to update our research as appropriate, but various regulations may prevent us from doing so. Other than certain industry reports published on a periodic basis, the large majority of reports are published at irregular intervals as appropriate in the analyst's judgment.

Goldman Sachs conducts a global full-service, integrated investment banking, investment management, and brokerage business. We have investment banking and other business relationships with a substantial percentage of the companies covered by Global Investment Research. Goldman Sachs & Co. LLC, the United States broker dealer, is a member of SIPC (https://www.sipc.org).

Our salespeople, traders, and other professionals may provide oral or written market commentary or trading strategies to our clients and principal trading desks that reflect opinions that are contrary to the opinions expressed in this research. Our asset management area, principal trading desks and investing businesses may make investment decisions that are inconsistent with the recommendations or views expressed in this research.

We and our affiliates, officers, directors, and employees will from time to time have long or short positions in, act as principal in, and buy or sell, the securities or derivatives, if any, referred to in this research, unless otherwise prohibited by regulation or Goldman Sachs policy.

The views attributed to third party presenters at Goldman Sachs arranged conferences, including individuals from other parts of Goldman Sachs, do not necessarily reflect those of Global Investment Research and are not an official view of Goldman Sachs.

Any third party referenced herein, including any salespeople, traders and other professionals or members of their household, may have positions in the products mentioned that are inconsistent with the views expressed by analysts named in this report.

This research is focused on investment themes across markets, industries and sectors. It does not attempt to distinguish between the prospects or performance of, or provide analysis of, individual companies within any industry or sector we describe.

Any trading recommendation in this research relating to an equity or credit security or securities within an industry or sector is reflective of the investment theme being discussed and is not a recommendation of any such security in isolation.

This research is not an offer to sell or the solicitation of an offer to buy any security in any jurisdiction where such an offer or solicitation would be illegal. It does not constitute a personal recommendation or take into account the particular investment objectives, financial situations, or needs of individual clients. Clients should consider whether any advice or recommendation in this research is suitable for their particular circumstances and, if appropriate, seek professional advice, including tax advice. The price and value of investments referred to in this research and the income from them may fluctuate. Past performance is not a guide to future performance, future returns are not guaranteed, and a loss of original capital may occur. Fluctuations in exchange rates could have adverse effects on the value or price of, or income derived from, certain investments.

Certain transactions, including those involving futures, options, and other derivatives, give rise to substantial risk and are not suitable for all investors. Investors should review current options and futures disclosure documents which are available from Goldman Sachs sales representatives or at https://www.theocc.com/about/publications/character-risks.isp and

https://www.fiadocumentation.org/fia/regulatory-disclosures_1/fia-uniform-futures-and-options-on-futures-risk-disclosures-booklet-pdf-version-2018.

Transaction costs may be significant in option strategies calling for multiple purchase and sales of options such as spreads. Supporting documentation will be supplied upon request.

Differing Levels of Service provided by Global Investment Research: The level and types of services provided to you by Goldman Sachs Global Investment Research may vary as compared to that provided to internal and other external clients of GS, depending on various factors including your individual preferences as to the frequency and manner of receiving communication, your risk profile and investment focus and perspective (e.g., marketwide, sector specific, long term, short term), the size and scope of your overall client relationship with GS, and legal and regulatory constraints. As an example, certain clients may request to receive notifications when research on specific securities is published, and certain clients may request that specific data underlying analysts' fundamental analysis available on our internal client websites be delivered to them electronically through data feeds or otherwise. No change to an analyst's fundamental research views (e.g., ratings, price targets, or material changes to earnings estimates for equity securities), will be communicated to any client prior to inclusion of such information in a research report broadly disseminated through electronic publication to our internal client websites or through other means, as necessary, to all clients who are entitled to receive such reports.

All research reports are disseminated and available to all clients simultaneously through electronic publication to our internal client websites. Not all research content is redistributed to our clients or available to third-party aggregators, nor is Goldman Sachs responsible for the redistribution of our research by third party aggregators. For research, models or other data related to one or more securities, markets or asset classes (including related services) that may be available to you, please contact your GS representative or go to https://research.gs.com.

Disclosure information is also available at https://www.gs.com/research/hedge.html or from Research Compliance, 200 West Street, New York, NY 10282.
